Quiz 9

	9.1	9.2	9.3
A	31%	77%	38%
B	8%	15%	23%
C	31%	0%	8%
D	31%	8%	8%
E	38%		
A	0%	0%	23%

Moving to molecules

- Apply our Newtonian framework and results to atoms and molecules.
- See what goes over directly, what we have to add.
- Can we integrate what we know about atoms and molecules from chemistry with the physics we have learned?

Foothold ideas: Bound states

- When two objects attract, they may form a *bound state* – that is, they may stick together.
- If you have to do positive work to pull them apart in order to get to a separated state with $KE = 0$, then the original state was in a state with negative energy.

Foothold ideas: Forces from PE

- For conservative forces, PE can be defined by

$$\vec{F} \cdot \Delta \vec{r} = -\Delta U$$

- If you know U , the force can be gotten from it via

$$F_{\parallel}^{type} = -\frac{\Delta U_{type}}{\Delta r} = -\frac{dU_{type}}{dr}$$

- In more than 1D need to use the *gradient*

$$\vec{F}^{type} = -\vec{\nabla} U_{type}$$

- The force always points down the PE hill.

If we have a complicated potential energy
– and a mass at rest in it – can we tell
where it will go when released?

How do you know?

What are the conditions under which this works?
