Preface to the Third Edition	xiii
Preface to the Second Edition	xvii
Preface to the First Edition	xix
Historical Introduction	xxi
1. The Statistical Basis of Thermodynamics	1
1.1. The macroscopic and the microscopic states	1
1.2. Contact between statistics and thermodynamics: physical significance of the number $\Omega(N, V, E)$	3
1.3. Further contact between statistics and thermodynamics	6
1.4. The classical ideal gas	9
1.5. The entropy of mixing and the Gibbs paradox	16
1.6. The “correct” enumeration of the microstates	20
Problems	22
2. Elements of Ensemble Theory	25
2.1. Phase space of a classical system	25
2.2. Liouville’s theorem and its consequences	27
2.3. The microcanonical ensemble	30
2.4. Examples	32
2.5. Quantum states and the phase space	35
Problems	37

3. The Canonical Ensemble	39	5.3. Examples	122
3.1. Equilibrium between a system and a heat reservoir	40	5.4. Systems composed of indistinguishable particles	128
3.2. A system in the canonical ensemble	41	5.5. The density matrix and the partition function of a system of free particles	133
3.3. Physical significance of the various statistical quantities in the canonical ensemble	50	Problems	139
3.4. Alternative expressions for the partition function	52	6. The Theory of Simple Gases	141
3.5. The classical systems	54	6.1. An ideal gas in a quantum-mechanical microcanonical ensemble	141
3.6. Energy fluctuations in the canonical ensemble: correspondence with the microcanonical ensemble	58	6.2. An ideal gas in other quantum-mechanical ensembles	146
3.7. Two theorems — the “equipartition” and the “virial”	61	6.3. Statistics of the occupation numbers	149
3.8. A system of harmonic oscillators	65	6.4. Kinetic considerations	152
3.9. The statistics of paramagnetism	70	6.5. Gaseous systems composed of molecules with internal motion	155
3.10. Thermodynamics of magnetic systems: negative temperatures	77	6.6. Chemical equilibrium	170
Problems	83	Problems	173
4. The Grand Canonical Ensemble	91	7. Ideal Bose Systems	179
4.1. Equilibrium between a system and a particle-energy reservoir	91	7.1. Thermodynamic behavior of an ideal Bose gas	180
4.2. A system in the grand canonical ensemble	93	7.2. Bose–Einstein condensation in ultracold atomic gases	191
4.3. Physical significance of the various statistical quantities	95	7.3. Thermodynamics of the blackbody radiation	200
4.4. Examples	98	7.4. The field of sound waves	205
4.5. Density and energy fluctuations in the grand canonical ensemble: correspondence with other ensembles	103	7.5. Inertial density of the sound field	212
4.6. Thermodynamic phase diagrams	105	7.6. Elementary excitations in liquid helium II	215
4.7. Phase equilibrium and the Clausius–Clapeyron equation	109	Problems	223
Problems	111	8. Ideal Fermi Systems	231
5. Formulation of Quantum Statistics	115	8.1. Thermodynamic behavior of an ideal Fermi gas	231
5.1. Quantum-mechanical ensemble theory: the density matrix	115	8.2. Magnetic behavior of an ideal Fermi gas	238
5.2. Statistics of the various ensembles	119	8.3. The electron gas in metals	247
		8.4. Ultracold atomic Fermi gases	258

8.5.	Statistical equilibrium of white dwarf stars	259	11.3.	Low-lying states of an imperfect Bose gas	361
8.6.	Statistical model of the atom	264	11.4.	Energy spectrum of a Bose liquid	366
	Problems	269	11.5.	States with quantized circulation	370
9.	Thermodynamics of the Early Universe	275	11.6.	Quantized vortex rings and the breakdown of superfluidity	376
9.1.	Observational evidence of the Big Bang	275	11.7.	Low-lying states of an imperfect Fermi gas	379
9.2.	Evolution of the temperature of the universe	280	11.8.	Energy spectrum of a Fermi liquid: Landau's phenomenological theory	385
9.3.	Relativistic electrons, positrons, and neutrinos	282	11.9.	Condensation in Fermi systems	392
9.4.	Neutron fraction	285		Problems	394
9.5.	Annihilation of the positrons and electrons	287	12.	Phase Transitions: Criticality, Universality, and Scaling	401
9.6.	Neutrino temperature	289	12.1.	General remarks on the problem of condensation	402
9.7.	Primordial nucleosynthesis	290	12.2.	Condensation of a van der Waals gas	407
9.8.	Recombination	293	12.3.	A dynamical model of phase transitions	411
9.9.	Epilogue	295	12.4.	The lattice gas and the binary alloy	417
	Problems	296	12.5.	Ising model in the zeroth approximation	420
10.	Statistical Mechanics of Interacting Systems: The Method of Cluster Expansions	299	12.6.	Ising model in the first approximation	427
10.1.	Cluster expansion for a classical gas	299	12.7.	The critical exponents	435
10.2.	Virial expansion of the equation of state	307	12.8.	Thermodynamic inequalities	438
10.3.	Evaluation of the virial coefficients	309	12.9.	Landau's phenomenological theory	442
10.4.	General remarks on cluster expansions	315	12.10.	Scaling hypothesis for thermodynamic functions	446
10.5.	Exact treatment of the second virial coefficient	320	12.11.	The role of correlations and fluctuations	449
10.6.	Cluster expansion for a quantum-mechanical system	325	12.12.	The critical exponents ν and η	456
10.7.	Correlations and scattering	331	12.13.	A final look at the mean field theory	460
	Problems	340		Problems	463
11.	Statistical Mechanics of Interacting Systems: The Method of Quantized Fields	345	13.	Phase Transitions: Exact (or Almost Exact) Results for Various Models	471
11.1.	The formalism of second quantization	345	13.1.	One-dimensional fluid models	471
11.2.	Low-temperature behavior of an imperfect Bose gas	355	13.2.	The Ising model in one dimension	476

13.3.	The n -vector models in one dimension	482	16.5.	Computer simulation caveats	650
13.4.	The Ising model in two dimensions	488		Problems	651
13.5.	The spherical model in arbitrary dimensions	508			
13.6.	The ideal Bose gas in arbitrary dimensions	519		Appendices	653
13.7.	Other models	526	A.	Influence of boundary conditions on the distribution of quantum states	653
	Problems	530	B.	Certain mathematical functions	655
14.	Phase Transitions: The Renormalization Group Approach	539	C.	“Volume” and “surface area” of an n -dimensional sphere of radius R	662
14.1.	The conceptual basis of scaling	540	D.	On Bose–Einstein functions	664
14.2.	Some simple examples of renormalization	543	E.	On Fermi–Dirac functions	667
14.3.	The renormalization group: general formulation	552	F.	A rigorous analysis of the ideal Bose gas and the onset of Bose–Einstein condensation	670
14.4.	Applications of the renormalization group	559	G.	On Watson functions	675
14.5.	Finite-size scaling	570	H.	Thermodynamic relationships	676
	Problems	579	I.	Pseudorandom numbers	683
15.	Fluctuations and Nonequilibrium Statistical Mechanics	583		Bibliography	687
15.1.	Equilibrium thermodynamic fluctuations	584		Index	707
15.2.	The Einstein–Smoluchowski theory of the Brownian motion	587			
15.3.	The Langevin theory of the Brownian motion	593			
15.4.	Approach to equilibrium: the Fokker–Planck equation	603			
15.5.	Spectral analysis of fluctuations: the Wiener–Khinchine theorem	609			
15.6.	The fluctuation–dissipation theorem	617			
15.7.	The Onsager relations	626			
	Problems	632			
16.	Computer Simulations	637			
16.1.	Introduction and statistics	637			
16.2.	Monte Carlo simulations	640			
16.3.	Molecular dynamics	643			
16.4.	Particle simulations	646
