
Physics 675: Introduction to relativity, gravitation and cosmology. Fall 2011

Professor: Manuel Tiglio

Lectures: Physics Building, **room 4102 (notice the change of room)**. Tuesday and Thursday: 2pm-3:15pm. **Exception, on Sept 29 we will use the room officially assigned to the class (namely, Physics, #1219)**

Office: Physics Building # 4205E.

Office hours: after class or by appointment

Email: tiglio@umd.edu

Teaching Assistant: Rong Zhou

Office: Physics Building, room 4207A

Email: zhour@umd.edu

Topics to be covered (to be expanded, depending on the pace of the class):

Differential geometry as needed to study basic General Relativity (manifolds, Lie and covariant derivatives, parallel transport, geodesics, curvature tensors, gauge invariance).

The Einstein equations

Linearized theory, gravitational waves.

Black hole solutions and analysis of their geometry.

Cosmology

The 3+1 decomposition

Homework (to be added during the semester)

- First homework: Problems at the end of section 4 of the class notes. Due: Sep 29 (at the beginning of that day's class).

- Second homework: Problems at the end of section 5 of the class notes. Due: Oct. 11 (at the beginning of that day's class).

Required textbook:

We will be following mostly "*An introduction to Spacetime and Geometry*", by Sean M. Carroll (edited by Pearson/Addison Wesley). We will not have time to cover all of it, though, and I will also take some material or examples from other books or from myself, but Carroll's book is an excellent read so spend as much time on it as possible for further discussions of what we will cover during lecture time!.

Here are my [lecture notes](#) (written and rewritten during the semester, so check back for updates often). Last update: Sep 30 at 8:11AM.

Below is list of other important bibliographic resources.

Other books and bibliographic resources:

- *“Problem book in relativity and gravitation”*, by Lightman, Press, Price and Teukolsky. Edited by Princeton University Press, 1975. A very valuable list of problems with solutions. Highly recommended. If you have the time, do all of them!.
- *“Semi-Riemannian geometry, with applications to relativity”*, by Barrett O’Neill. Mostly a book on the differential geometry aspect of GR. Very readable.
- *“Gravitation”*, by Misner, Thorne and Wheeler. Edited by W. H. Freeman, 1973. A classic among classics. Usually referred to as “MTW”. If you are interested in GR, you should have a copy of this huge book for reference on so many topics. I would not recommend it as text to learn GR, but certainly a must have once you have learned GR.
- *“Gravity, an introduction to Einstein’s General Relativity”*, by James Hartle (edited by Addison Wesley). An excellent book exploring the physics of GR using little math. It is many times used as a textbook for undergraduate courses in GR.
- *“Gravity from the ground up”*, by Bernard Schutz (edited by Cambridge). It uses very little math and instead it focuses on “high level” discussions of many aspects related to gravity. A very good complementary read.
- *“General Relativity”*, by Robert M. Wald (edited by The University of Chicago Press). One of the best books, but rather terse. Carroll’s book in fact can be seen as a “more legible, with more explanations” version of around half of the material in Wald’s. Probably not a book to learn GR for the first time.
- *“The large scale structure of spacetime”*, by Stephen Hawking and George Ellis, edited by Cambridge University Press (1975). Excellent book, with a focus on the singularity theorems, along with their proofs. Probably not the best place to start learning GR.
- *“Relativity”*, by Albert Einstein, with an introduction by Roger Penrose and Commentary by Robert Geroch. Edited by PI Press, 2005. This is a short book written by Einstein himself for the lay public, with modern comments and an introduction by Geroch and Penrose, respectively.
- Living reviews in Relativity: a collection of online reviews written by experts in their fields and edited by the Max Planck Society. They are expected to be updated by the authors, so they present the state of the art of any topic related to GR at a high level. Excellent resource.

Grading:

80% of the final grade will be based on homework, and 20% on a term project paper (4-5 pages long) and presentation (20-30 mi long) of a study project (typically, studying topics that we will not have time to include in the course) that you will choose around the middle of the semester from a list that I will make available by then. Upon discussion, the term paper can be traded by a short but innovative research project. There is no final exam.

Grades:

A: 90%-100%

B: 80%-89%

C: 60%-79%

D: 50%-59%.

Attendance:

it is not required, except for the last classes, where we will have the presentations. The exact schedule will be announced in class and posted here, once the exact number of students and

schedule is known.

Announcements

All announcements (new homework being posted, deadlines, etc) will be done by email, even if they have also been done during lecture time. These will be based on your email address registered with the university, so please make sure that you have the correct one registered, that you check your email often, and that my own address does not get filtered by anti-spam software.

Webpage

The webpage of the course is

<http://www.cscamm.umd.edu/people/faculty/tiglio/GR2011/Syllabus.html>

Check it regularly for homework, deadlines, and other.

Homework policy:

Homework assignments and their deadlines will be sent by email and posted on this webpage.

- o Please turn in the homework to Rong (your TA) by the specified deadline. You will usually have around one week to work on your homework. One week after each deadline, the graded homework will be ready to be picked up from your TA and discussed during her office hours.
- o In grading the turned in assignments your work for reasoning, logic, completeness and clear explanations will be considered. Points will be deducted if your answer is hard to read or difficult to understand, or the logic not clearly explained, even if the final result is correct.
- o Late homework will **only** be accepted under the exceptional circumstances stipulated by UMD (see below).
- o You are encouraged to discuss the homework with others. You can even work them out with others! (it is a very good way to learn, in fact). However, the work you turn in should reflect your own formulation and understanding.

Effectiveness in class participation

In order to take advantage of lecture time and the array of topics to be covered, it is strongly encouraged that you try to read the material of each lecture ahead of time, even if you only have time for a "casual" read. We will usually proceed in an interactive manner. By the end of each class we will discuss what the next class topic will be.

Make-up exams policy

The course will adhere to the University policy for make-up exams and late homework, see <http://www.testudo.umd.edu/soc/atedasse.html> for a full description of it. A summary follows:

"In order to get a make up for a missed exam you need to provide in written the reason, which has to be one of allowed by the university. Namely, due to illness (of the student or a dependent), religious observance (where the nature of the observance prevents the student from being present during the class period), participation in University activities at the request of University authorities, or compelling circumstances beyond the student's control. Students claiming excused absence must apply in writing and furnish documentary support for their assertion that absence resulted from one of these causes. "

“Students who have a concern regarding religious observances should see their instructors at the start of the semester. Although the University attempts to accommodate the religious beliefs of all of its members, it functions within a secular environment and is limited in the extent to which it can interrupt its normal operations. The President shall determine when it is appropriate for the campus community to restrict rescheduling examinations or other significant assessments on the dates of religious observance.

At this time, examinations or other significant assessments may not be scheduled on Rosh Hoshanah, Yom Kippur, Good Friday, or the first two days of Passover.”

It is the student's responsibility to inform me, by email, within the first two weeks of classes, of any intended absences or delays in handling homework, **for the whole semester**, due to religious observances.

Students with disabilities

Students with disabilities should contact me as soon as possible so that appropriate arrangements can be made to accommodate the student's needs.

Academic integrity

The University of Maryland, College Park has a nationally recognized Code of Academic Integrity, administered by the Student Honor Council. This Code sets standards for academic integrity at Maryland for all undergraduate and graduate students. As a student you are responsible for upholding these standards for this course. It is very important for you to be aware of the consequences of cheating, fabrication, facilitation, and plagiarism. For more information on the Code of Academic Integrity or the Student Honor Council, please visit <http://www.shc.umd.edu>.

To further exhibit your commitment to academic integrity, remember to sign the Honor Pledge on all examinations and assignments: "I pledge on my honor that I have not given or received any unauthorized assistance on this examination (assignment)."
