A King plot in our publication used literature $D_{2}$ isotope shifts along with our $D_{1}$ isotope shift measurements to extract combinations of the mass and field shift constants to compare with theory. The ${ }^{206} \mathrm{Fr}$ point was in strong disagreement with the linear fit of the King plot. This $10 \sigma$ discrepancy has been resolved with an updated $D_{2}$ isotope shift [1], determined using more data with better frequency resolution, and we now include it in our King plot analysis. Additionally, the $D_{2}$ isotope shift and ground-state hyperfine splitting for the isomer ${ }^{206 m} \mathrm{Fr}$ are now available [1]. This enables us to determine its $D_{1}$ isotope shift and include it in our King plot.

We include revised versions of Fig. 4 and Table I here. The revised King plot now has slope $F_{D_{2}} / F_{D_{1}}=1.0521(8)$ and intercept $\left(N_{D_{2}}+S_{D_{2}}\right)-\left(N_{D_{1}}+S_{D_{1}}\right) \frac{F_{D_{2}}}{F_{D_{1}}}=194(78) \mathrm{GHz}$ amu with $\chi^{2} / n d f=7.00094 / 7$. Evaluating the normal mass shift constants

TABLE I. Revision and addition to Table I, using our measured $D_{1}$ isotope shifts and the nuclear spins, $D_{2}$ isotope shifts, and ground-state hyperfine splittings from [1]. The $D_{2}$ isotope shifts are recalculated using ${ }^{221} \mathrm{Fr}$ as the reference isotope as in our previous paper.

|  | Our paper |  |  | Ref. [1] |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Isotope | $A\left(P_{1 / 2}\right)(\mathrm{MHz})$ | $D_{1} \delta \nu_{\text {IS }}(\mathrm{MHz})$ |  | Spin | $A\left(S_{1 / 2}\right)(\mathrm{MHz})$ |
| 206 m | $869.91(8)$ | $29236(5)$ | 7 | $D_{2} \delta \nu_{\text {IS }}(\mathrm{MHz})$ |  |
| 206 | $1716.9(2)$ | $29175(5)$ | 3 | $6616.0(7)$ | $30689(5)$ |

| Fit Results |
| :---: |
| $\chi^{2} / \mathrm{ndf}=7.00094 / 7$ |
| slope $=1.0521 \pm 0.0008$ |
| int $=194 \pm 78 \mathrm{GHz} \mathrm{amu}$ |

FIG. 1. (Color online) Revised Fig. 4. The King plot fit now includes ${ }^{206} \mathrm{Fr}$ and ${ }^{206 m} \mathrm{Fr}$.
produces the specific mass shift constant difference $\delta \mathcal{S}$ between the two transitions $\delta \mathcal{S}=S_{D_{2}}-S_{D_{1}} \frac{F_{D_{2}}}{F_{D_{1}}}=176(78) \mathrm{GHz} \mathrm{amu}$. The main conclusions on the specific mass shift difference and the field shift ratio are unchanged. This reaffirmed precise result becomes a possibly useful constraint on higher-order physics contributing to a King plot.
