■ Theme Music: Arvo Pärt Spiegel im Spiegel (Mirror in Mirror)

■ Cartoon: Virgil Partch

## Outline

■ Go over Quiz 10
■ Plane mirrors

- Virtual images

■ Spherical mirrors

- Real images

■ Examples

## Quiz 10

A

| 1.1 | 1.2 | 1.3 | 1.4 |  | 2.1 |  | 2.2 |  | 2.3 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $3 \%$ | $1 \%$ | $87 \%$ | $11 \%$ | 6 | $57 \%$ | 0.2 | $4 \%$ | Y | $86 \%$ |
| $16 \%$ | $3 \%$ | $8 \%$ | $68 \%$ | 6.2 | $8 \%$ | 0.4 | $63 \%$ | N | $13 \%$ |
| $63 \%$ | $10 \%$ | $2 \%$ | $11 \%$ | 6.4 | $6 \%$ | 0.5 | $15 \%$ |  |  |
| $10 \%$ | $68 \%$ | $1 \%$ |  | other | $30 \%$ | 0.8 | $6 \%$ |  |  |
|  | $18 \%$ | $3 \%$ |  |  |  | other | $12 \%$ |  |  |

## Foothold Ideas 1: <br> The Physics

■ Certain objects (the sun, bulbs,...) give off light.
■ Through empty space (or ~air) light travels in straight lines.
■ Each point on an object scatters light, spraying it off in all directions.

- A polished surface reflects rays back again according to the rule: The angle of incidence equals the angle of reflection.

## Foothold Ideas 2: <br> The Psycho-physiology

■ We only see something when light coming from it enters our eyes.
■ Our eyes identify a point as being on an object when rays traced back converge at that point.
(An over-simplification)

# Where does an object seen in a mirror appear to be? 

## What happens when a ray hits a curved mirror?

## A Spherical Mirror: Central Rays

A few rays are easy to figure out

All rays satisfy the "angle of incidence = angle of reflection" measured to the normal to the surface

All rays through the center strike the mirror perpendicular to the surface and bounce back along their incoming path.

## A Spherical Mirror: Central Ray

A few rays are easy to figure out where they go.
center of sphere

All rays satisfy
the "angle of incidence $=$ angle of reflection" measured to the normal to the surface

The ray hitting the central line of the diagram is particularly simple.

## A Spherical Mirror: Parallel Rays

## Kinds of Images: Real

$\square$ In the case of the previous slide, the rays seen by the eye do in fact converge at a point.
$■$ When the rays seen by the eye do meet, the image is called real.
■ If a screen is put at the real image, the rays will scatter in all directions and an image can be seen on the screen, just as if it were a real object.
